

Assignment 2 - Worksheet

Social Media and Network Analysis (COSC 2671 / COSC 3047)

Postgraduate Group 42

Vihang Mehere (s4149812) | Siddhant Kripal (s4184755)

1. Project Plan

Aim

Analyse five AI-focused subreddits (r/MachineLearning, r/LocalLLaMA, r/ChatGPT, r/artificial, r/OpenAI) around three 2024 model releases (Llama 3, GPT-4o, Claude 3.5 Sonnet). Use VADER sentiment and LDA topics on posts/comments, and co-comment networks (pre / peak / post windows) to compare how communities differ in tone, themes, and interaction structure.

Roles

Member	Responsibility	Backup
Vihang Mehere (s4149812, leader)	PullPush collection, pipeline, config, report structure (intro, methods, limitations)	NLP / networks
Siddhant Kripal (s4184755)	Preprocessing checks, VADER/LDA, networks, figures, results & discussion	Collection / integration

Timeline

Week	Milestone	Owner
8	Team formed, topic agreed, repo + config.yaml	All
9	Reddit data collection (PullPush), raw CSVs	Vihang
10	Preprocessing, sentiment, LDA topics	Siddhant
11	Co-comment networks, figures, report draft	Both
12	Revision, GitHub push, Canvas submission	All

Communication

- Met twice weekly on Microsoft Teams; day-to-day coordination in group chat.
- Shared code and outputs via GitHub (https://github.com/Vihang30/SMNA_Group42); commit history tracked progress.

2. Weekly Timesheets

Vihang Mehere (s4149812)

Week	Tasks	Hours	Notes
Week 8	Topic choice, team plan, initial config and README	5	

Week 9	PullPush collector, pagination fixes, scrape submissions/comments	9	API rate limits
Week 10	Preprocess module, run_pipeline.py, debug empty-comment path	8	
Week 11	Network testing, sample export, notebook, report Sections 1–8	10	
Week 12	Report revision, access file, submission folder	6	

3. Self-Reflection

I Vihang,

I led the PullPush data collection and wired the pipeline in run_pipeline.py. The hardest part was API pagination and comment caps, and being honest in the report when Llama 3 and Claude pre-phase cells were sparse. Fixing preprocess edge cases (empty comments, deleted authors) took longer than expected.

Working with Siddhant was smooth: he owned NLP and network figures while I focused on collection and report structure. Teams syncs twice a week helped us keep the same release windows in config.yaml.

I improved most in building a reproducible Python project (config-driven paths, small src modules). Next time I would filter bot accounts before centrality analysis and log timesheets weekly.

Estimated contribution: Vihang ~50%, Siddhant ~50% , fair for our skill split.
